1. A method of communicating, the method comprising:

effecting communication between first and second radio transceivers via a' telecommunications network over a first channel;

determining the distance between the first and second radio transceivers; determining whether the distance between the two transceivers meets a predetermined threshold; and

in response to a determination that the threshold is met, effecting direct

mode communication between the first and second radio transceivers over a second channel.

- 2. A method as claimed in claim 1, in which the second channel has a greater bandwidth than the first channel.
- 3. A method as claimed in claim 1 or claim 2, further comprising, prior to the effecting direct mode communication step, estimating the quality of the second channel.
- 4. A method according to any preceding claim, in which the determining steps are carried out at the first radio transceiver.
 - 5. A method according to any preceding claim, in which the distance determination step includes determining the locations of the first and second radio transceivers.
 - 6. A method as claimed in claim 5, in which the location determination involves a satellite-based position system.
- 7. A method as claimed in any of claims 1 to 5, in which the location determination involves triangulating from plural fixed radio transceivers, preferably forming part of the telecommunications network.

30

- 8. A method as claimed in any preceding claim, in which the first and second channels are of different channel types.
- 9. A method as claimed in any preceding claim, in which the direct mode communication step is effected only if a bandwidth or other service demand exceeds the capability of the first channel.
 - 10. A method as claimed in any preceding claim, in which the threshold is dependent on the sum of the radio coverage of the first and second radio transceivers.
 - 11. A radio transceiver, comprising:
 - a communicator for communicating with a remote radio transceiver via a telecommunications network over a first channel;
- a determiner for determining the distance between the transceiver and the remote transceiver, and for determining whether the distance meets a predetermined threshold; and
 - a channel charger, responsible to a determination that the threshold is met, for effecting direct mode communication between the transceiver and the remote transceiver over a second channel.
 - 12. A radio transceiver as claimed in claim 11, in which the second channel has a greater bandwidth than the first channel.
- 25 13. A radio transceiver as claimed in claim 11 or claim 12, further comprising an estimator arranged to estimate the quality of the second channel.
 - 14. A radio transceiver as claimed in any of claims 11 to 13, including a satellite positioning receiver, arranged to calculate the location of the transceiver.
 - 15. A radio transceiver as claimed in any of claims 11 to 14, in which the first and second channels are of different types.

WO 2004/006468 PCT/IB2003/003006

- 10 -

16. A system for effecting communication between first and second radio transceivers, comprising:

5

10

a communicator for effecting communication between the first and second radio transceivers over a first channel;

a determiner for determining the distance between the transceivers, and for determining if the distance meets a predetermined threshold; and

a channel charger responsive to a determination that the threshold is met, for effecting direct mode communication between the transceivers over a second channel.
